Define the Problem Statements

AI-Based Localization And Classification Of Skin Disease With Erythema

Problem Statement :

Now a day's people are suffering from skin diseases, More than 125 million people suffering from Psoriasis also skin cancer rate is rapidly increasing over the last few decades especially Melanoma is most diversifying skin cancer. If skin diseases are not treated at an earlier stage, then it may lead to complications in the body including spreading of the infection from one individual to the other. The skin diseases can be prevented by investigating the infected region at an early stage. The characteristic of the skin images is diversified so that it is a challenging job to devise an efficient and robust algorithm for automatic detection of skin disease and its severity. Skin tone and skin colour play an important role in skin disease detection. Colour and coarseness of skin are visually different. Automatic processing of such images for skin analysis requires quantitative discriminator to differentiate the diseases. Automatic processing of such images for skin analysis requires quantitative discriminator to differentiate the diseases.

Solution:

To overcome the above problem we are building a model which is used for the prevention and early detection of skin cancer, psoriasis. Basically, skin disease diagnosis depends on the different characteristics like colour, shape, texture etc. Here the person can capture the images of skin and then the image will be sent the trained model. The model analyses the image and detect whether the person is having skin disease or not.

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
To detect the erythema skin diseaseas earlier as possible,to prevent the skin cancer.	Person with skin disease	Figure out if my disease is erythema or not.	I can't find any website which gives accurate result	There is no customized website to detect only erythema and so the accuracy is low.	Worried and Irresolute
To detect the type of skin disease using machine learning model.	Skin disease detector	To detect the person having such disease by image.	But only detects whether having disease or not.	Because it can't able to predict the which disease accurately.	The level of usage and need is low.
